

## Specified Heart Arrhythmia

At Healthfirst, we are committed to helping providers accurately document and code their patients' health records. This tip sheet is intended to assist providers and coding staff with the documentation and **ICD-10-CM selection**, specifically for common types of **Specified Heart Arrhythmia**. It provides information from industry sources about proper coding practice. However, this document does not represent or guarantee that Healthfirst will cover and/or pay for services outlined. Coverage decisions are based on the terms of the applicable evidence of coverage and the provider's participation agreement. This includes the determination of any amounts that Healthfirst or the member owes the provider.

**Specified Heart Arrhythmia.** Heart rhythm problems occur when the electrical impulses in the heart don't function properly, causing the heart to beat too fast, too slowly, or irregularly.

| Clinical Documentation Should Include |                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Z95.*</b>  | Presence of cardiac and vascular implants and grafts         |
| <b>Z86.79</b> | Personal history of other diseases of the circulatory system |
| <b>R00.*</b>  | Abnormalities of heartbeat                                   |

\*Requires additional digits to complete the diagnosis code.

## Specified Heart Arrhythmia

# Documentation and Coding

## Coding Tips

- Code all chronic conditions that are currently being treated.
- Document to the highest level of specificity for appropriate ICD-10 code assignment.
- Other Include terms for code **I47.19** - Atrial (Paroxysmal) Tachycardia:
  - Atrioventricular [AV] (paroxysmal) tachycardia
  - Atrioventricular re-entrant (nodal) tachycardia [AVNRT] [AVRT]
  - Junctional (paroxysmal) tachycardia
  - Nodal (paroxysmal) tachycardia
- For **I47.21** - Torsades De Pointes, code also, if applicable, long QT Syndrome (**I45.81**) and use additional codes for adverse effect, if applicable, to identify drug (T36–T50 with fifth or sixth character 5\*).
- For **I47.22** - Catecholaminergic polymorphic ventricular tachycardia [CPVT] include term is Familial polymorphic ventricular tachycardia [FPVT]
- Use code **I49.81** for Brugada syndrome & I49.82 for Ventricular bigeminy
- For **I49.82** - Ventricular bigeminy, Use Additional code, if applicable, for associated symptoms such as: Dizziness (**R42**) and Syncope (**R55**)
- Use code **I49.89** for Coronary sinus rhythm disorder, Ectopic rhythm disorder and Nodal rhythm disorder

## Coding Example

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Case</b>      | A patient who was admitted due to syncopal episodes was diagnosed with complete heart block. The cardiologist noted that the electrocardiogram (ECG) showed a complete AV block with periods of asystole over six seconds with conversion to sinus bradycardia. There was no mention of cardiac arrest. During the stay, a permanent pacemaker was placed, and the patient was discharged in stable condition. Is it appropriate to assign an additional code for the asystole? |
| <b>Rationale</b> | No. Assign only code <b>I44.2</b> , Atrioventricular block, complete. It would not be appropriate to code asystole (cardiac arrest) when a brief pause of electrical activity with spontaneous recovery of sinus rhythm is noted on an ECG. In this case, the brief periods of asystole are due to the complete heart block. AHA Coding Clinic 2019, 2nd Quarter                                                                                                                |
